1. What service laboratories are developing EW payloads/packages for small unmanned aircraft systems (sUASs) (group1/2)? What companies can be leveraged to create attributable EW payloads?

2. Are there any solutions on the market or in development for personnel with limited EW experience? Are there any automated artificial intelligence capable EW packages to limit user involvement? (i.e. robust frequency hopping, automated signal jamming etc.)?

3. How much electrical power is required for the EW payload? Is there a viable solution for addition of an EW payload with an amplifier that does not significantly increase weight significantly.

4. What payloads can easily switch between different sUAS airframes?
